Choose one of your favorite websites and identify 5 different HTML elements used on the website. Make sure to include the URL in your submission.

What is your favorite thing you learned this week?

In this site there are <div> tags used to divide the website into different CSS scripts, <style> tags used for fonts, I personally use dark mode because its better on the eyes. <article> tags used to form the calculator itself. <img> used to make the main background. <iframe> used to display a webpage within a webpage.

My favorite thing I've learned this week is learning how to use HTML. Mostly because up to this point, we've only used HTML to link to a JavaScript file and nothing else, and I'm excited to start making proper web pages using the skills we have learned so far. I'm also excited [and a bit nervous] to apply everything we've learned so far and put it all together into a website. I've noticed several websites including GitHub have JavaScript scripts inside their webpages.
